

The DRX-4C comes equipped with an NTEP-approved, legal-for-trade counting feature for prescription filling. It can count up to 90 pills per second, and has a database capacity which allows it to store over 3000 NDC codes and pill weights. By updating the stored sample sizes and weights, the NDC codes for new drugs are quickly and easily added to the database. A short wizard leads the user step-by-step through the simple operation, allowing the user to easily create a database, choose a sample size for determining average piece weights, and verify the sample weight. This feature is easy to use and saves pharmacy time.
