

Quality begins with Design

The initial design has a great deal to do with the final quality of the pill counter as well as the type of experience the user will have with the product. The user has a number of things to look for in determining whether or not they are buying a quality pill counting scale.

The heart of a quality is its load cell and suspension. The load cell should be of the electromagnetic force restoration type where the weight of the unknown is balanced out by the force generated by sending an electric current through a coil which is sitting in a high level magnetic field. The suspension should be of the Roberval type which compensates for end and side loads and allows the scale to be top loading.
